

I decided to go over why we're focusing on why the two biggest options are flying versus driving. There are other safer modes of transportation, but people are generally going to either fly or drive to places, because we're all busy people and other modes of transportation can be cumbersome. I didn't want someone to listen to this video and then go, well, I'm just going to ride a train to my next vacation because it's just as safe as flying so I wanted to go over why that might not be the best option. Then of course I wanted to talk about the safety of flying over driving on a yearly basis and on a mile basis so that people can see that in both accounts, flying is safer. Also wanted to go over why it's safer in the United States and the training required to get your license. I did not use a script but I did go over what I wanted to say beforehand. I love the infographic that I made so I thought that it would be the best choice. Especially when only having three minutes to go over as much as possible. If the presentation would be longer, like 10 minutes or more, I think it would be more useful to use a powerpoint. Obviously with such a short audio video, there's a lot of detailed information missing. This still doesn't cover everything. One thing I did want to go over but didn't get the chance was, even though there have been issues with the airlines in the news lately, there haven't been any deaths. Only some minor injuries and some inconveniences. That's also why I focus on the deaths. Even if airlines had a higher chance of minor injuries, if driving still had this drastic difference in deaths, I would still think flying is safer. However, due to the cost of healthcare in the United States, if airlines had a higher chance of injury, then it would definitely hurt their numbers.
